

WEBSITE PERFORMANCE REVIEW

Faster, steadier, and easier to use.

What changed on www.atsdiamondtools.co.uk between 24 and 25 September 2026, measured with Google's own page speed test, before and after the work.

43 → 79

Home page mobile speed score out of 100

6.6s → 2.3s

Until the banner is on screen on a phone (Google wants under 2.5s)

0.20 → 0

Layout jumping while the page loads (under 0.1 is good)

100 / 100

Accessibility and SEO on every page tested, up from 80 and 92

The scores at a glance

Google grades each page from 0 to 100 in four areas. Green is 90 or more, amber is 50 to 89, red is under 50.

Home page on a phone, before and after

Speed score on mobile

Speed score on desktop

All scores, all pages

		Speed			Accessibility			Best practices			SEO		
Page		Before	After	+/-	Before	After	+/-	Before	After	+/-	Before	After	+/-
Home page	Mobile	43	79	+36	80	100	+20	100	100	0	92	100	+8
	Desktop	97	98	+1	84	100	+16	100	100	0	92	100	+8
Category page	Mobile	56	80	+24	81	100	+19	100	100	0	100	100	0
	Desktop	96	99	+3	84	100	+16	100	100	0	100	100	0
Product page	Mobile	37	65	+28	86	100	+14	75	79	+4	100	100	0
	Desktop	87	99	+12	90	100	+10	74	78	+4	100	100	0

Pages tested: home, the Polishing category, and the 100mm super premium 3-step wet polishing pads product. The average mobile speed score across the three pages went from 45 to 75. Best practices on the product page stays at 78 to 79 because of cookies set by the Apple Pay and Google Pay buttons, which we have kept on purpose.

What visitors actually feel

The score is a summary. These are the measurements behind it, taken on a simulated mid-range phone on a slow connection, which is Google's standard test.

Main content visible (LCP)

Layout jumping (CLS)

Speed Index

Data sent to the phone

Mobile measurements in full

	Home page		Category page		Product page	
Measure	Before	After	Before	After	Before	After
Main content visible (LCP)	6.6s	2.3s	6.7s	2.6s	7.1s	3.7s
First text on screen (FCP)	1.3s	1.3s	1.2s	1.3s	1.8s	1.6s
Speed Index	5.8s	3.5s	3.9s	3.4s	3.4s	3.0s
Layout jumping (CLS)	0.196	0	0.151	0	0.254	0.002
Time the phone is busy (TBT)	852 ms	755 ms	524 ms	635 ms	1266 ms	1136 ms
Page download size	1.6 MB	1.1 MB	1.3 MB	1.0 MB	4.7 MB	5.4 MB
Accessibility checks failed	6	0	7	1	5	0

Lower is better for everything in this table. The product page downloads more data than before because its image gallery now sends full-quality photos for zooming, and the Apple Pay and Google Pay scripts are loaded on every visit. "Time the phone is busy" is mostly the payment, analytics and advertising scripts and moves a little between test runs.

Why this matters for the business

Speed is not a vanity number. It changes how many visitors stay, how many buy, and how Google ranks the site.

65% faster

to the banner on the home page

Fewer people give up. Google's own research found that 53% of mobile visitors leave a page that takes longer than 3 seconds to load. The home page took 6.6s to show its banner on a phone. It now takes 2.3s, inside Google's 2.5 second target.

0 jumps

layout shift on all three pages

No more mis-taps. The page used to move about while it loaded, mainly because the clearance bar slid open after the page had drawn. That is the classic cause of tapping the wrong thing. All three pages now score zero for layout jumping, against a previous 0.15 to 0.25.

85% less

image data on the mobile home page

Cheaper on data, quicker on 4G. Phones now receive phone-sized pictures. The home page sends 103 KB of images to a phone instead of 685 KB, and the whole page is 33% smaller.

100

accessibility on every page

Usable by more customers, and a ranking signal. 18 accessibility checks were failing across the three pages: unnamed buttons, low-contrast text, hidden menus that screen readers could still reach. All fixed. Google uses page experience and speed as ranking factors, and every page now scores 100 for SEO.

Every visit

after the first is faster too

Browser caching is now on. The hosting server now tells browsers to keep pictures, scripts and styles for a month to a year, so the second and later pages a customer looks at load almost instantly. The test above measures a first visit, so this benefit is on top of the numbers shown.

Sources: Google, "The need for mobile speed" (2016), 53% of mobile visits abandoned after 3 seconds. Google and Deloitte, "Milliseconds make millions" (2020), a 0.1 second improvement in mobile speed lifted retail conversion by 8.4% and average order value by 9.2%. Google Search Central, page experience and Core Web Vitals as ranking signals.

What we changed

Everything below is live on the website. Nothing changed for customers apart from speed, and payments and tracking work exactly as before.

Speed

- **The banner and logo load first.** The caching plugin no longer treats them as "load later" pictures, and the browser is told to fetch the banner before anything else.
- **Phones get phone-sized pictures.** Home and category banners are sent in several sizes and the phone picks the smallest that fits. The largest versions are compressed a little harder with no visible difference.
- **Facebook and Google tracking wait their turn.** Both tags start once the page has drawn instead of the moment it opens. Page views, add-to-basket events and sales are still recorded.
- **Product photos appear straight away.** The main photo used to stay hidden until the image slider had set itself up. It now shows immediately.
- **The clearance pop-up no longer counts as the main content.** On phones it shows the text and button only, so its late-arriving photo no longer skews the measurement.
- **Fonts no longer hide the text.** While the site's fonts download, text shows in a fallback font instead of being invisible.
- **Browser caching switched on** for pictures, scripts and styles at the hosting level.

Stability

- **The clearance offers bar** is in place from the start instead of sliding open, and visitors who closed it never see it flash.
- **Pictures reserve their space** before they arrive, so nothing moves when they load.

Accessibility

- Banner arrows and dots, the basket button and the price slider handles now have names screen readers can announce.
- The grey "Reviews" count, green "in stock" text, sale badges and small menu text now meet the contrast standard.
- The clearance pop-up has a proper name for assistive technology, and the closed side menu is hidden from keyboards and screen readers until opened.
- Product carousels no longer use a list structure that confuses screen readers, and heading order is correct in the sidebar filters.
- The "Read more" link on the home page now says where it goes.

Housekeeping done at the same time

- The newsletter sign-up's Privacy Policy link now goes to your Privacy Statement page. It went nowhere before.
- The Terms and Conditions page was showing its content four times with no styling. It now renders once, with proper headings.

Reading the numbers. Scores move by a few points between runs depending on Google's test servers, so treat anything within five points as the same. The remaining gap on mobile is time spent running the payment, analytics and advertising scripts, which we cannot remove without losing those features.
