

Website speed and accessibility review: after improvements

www.atsdiamondtools.co.uk · live site, measured 25 September 2026 · prepared by Red Frog Studio

This is the follow-up to the review we sent yesterday. The changes described in that report are now on the live website, and these scores were taken on the live site with the same Google page speed test, on the same three pages, on both mobile and desktop.

Scores

Page	Device	Performance	Accessibility	Best practices	SEO
Home page	Mobile	79	100	100	100
	Desktop	98	100	100	100
Category page (Polishing)	Mobile	80	100	100	100
	Desktop	99	100	100	100
Product page (100mm diamond brush)	Mobile	64	94	79	100
	Desktop	95	94	78	100

Scores are out of 100. 90 to 100 good 50 to 89 needs work 0 to 49 poor

Key measurements, home page on mobile

Measurement	Before	After	What it means
Performance score	43	79	Google's overall speed grade for the page on a slow phone connection.
Accessibility score	80	100	How well the page works with screen readers and for people with poorer eyesight.
Main content visible	6.6 seconds	2.3 seconds	How long until the banner picture is on screen. Google wants under 2.5 seconds.
Time the phone is busy	850 ms	750 ms	How long the phone is too busy running scripts to respond to taps. Most of what is left is the payment and analytics scripts.
Layout jumping	0.196	0	How much the page shifts about while loading. Under 0.1 is good; it is now zero.

The short version

Every page now scores 100 for SEO, and the home and category pages score 100 for accessibility and best practices too (the product page keeps its lower best practices score because of the Apple Pay and Google Pay buttons, see below). The layout jumping Google flagged on every page is gone. On mobile the home page has gone from 43 (poor) to 79, the category page from 56 to 80 and the product page from 37 to 64, with the main content appearing in 2.3 seconds instead of 6.6. On desktop all three pages now score 95 to 99.

What we changed

- **The banner picture and logo now load first.** The caching plugin no longer treats them as "load later" pictures, and the browser is told to fetch the banner before anything else.
- **Phones get phone-sized pictures.** The home page banner and category banners are now sent in several sizes and the phone picks the smallest one that fits its screen. The largest versions are also compressed a little harder with no visible difference.
- **Facebook and Google tracking wait their turn.** Both tags now start once the page has drawn instead of the moment it opens. Page views, add-to-basket events and sales are still recorded exactly as before.
- **The page no longer jumps while loading.** The clearance offers bar at the top of the page used to slide open after the page had drawn, pushing everything down. It is now in place from the start, and visitors who have closed it never see it flash. Pictures also have their space reserved before they arrive.
- **Product pictures appear straight away.** On product pages the main photo used to stay hidden until the image slider had finished setting itself up. It now shows immediately and the slider takes over once it is ready.
- **The clearance offers pop-up no longer counts as the main content.** The pop-up opens two seconds after the page loads with a large photo. On phones Google was sometimes treating that late-arriving photo as the page's main content, which made the "main content visible" time look far worse than it is (12.8 seconds in one of your own tests). The photo is now sent at its real size and left out on phone screens, where the pop-up shows the text and button only.
- **Fonts no longer hide the text.** While the site's fonts are downloading, text is shown in a fallback font instead of being invisible.

Accessibility fixes

- The banner's next, previous and dot buttons, the basket button and the price slider handles now have names that screen readers can announce.
- The faint grey "Reviews" count, the green "in stock" text, the green sale badges and the small grey text in the category menu have been darkened enough to meet the contrast standard.
- The clearance offers pop-up now has a proper name for assistive technology, and the closed side menu is hidden from keyboard and screen-reader users until it is opened.
- The product carousels no longer use a list structure that confuses screen readers, and the sidebar filter headings follow the correct order.
- The "Read more" link on the home page now says where it goes.

Notes on the scores

Two things worth knowing when you run the test yourself:

- Product pages load Apple Pay and Google Pay from the payment provider, which sets cookies. Google's test marks down under best practices (score 78 to 79). This was the case before and we have left it alone because the payment buttons are worth more than the points.
- The remaining mobile score gap is mostly time spent running the payment, analytics and advertising scripts, which we cannot remove without losing those features. Scores also move by a few points between runs depending on Google's test servers, so treat anything within five points as the same.

The before figures were taken on the live site yesterday with the same tool and settings, so this is a like for like comparison.

What is left to do

- Switch on browser caching for pictures, scripts and styles in the hosting control panel (Plesk). This is a one-off hosting setting; we will supply the exact lines. It mainly speeds up the second and later pages a visitor looks at, which the test does not measure but customers will feel.
- One footer link in the newsletter text still points nowhere. That is a content setting rather than code, and we can fix it in a minute if you tell us where it should go.
